

METHOD AND SYSTEM FOR ASSIGNING AND REPORTING PREVENTATIVE MAINTENANCE WORKORDERS

ABSTRACT OF THE DISCLOSURE

A method and system for assigning and reporting a plurality of preventative maintenance workorders is generally implemented by a computer system, including a computer network, interfaces, and a database. The method and system permit assigning and reporting preventative maintenance workorders via an electronic mailbox associated with each interface. Maintenance data associated with the preventative maintenance procedure is recorded on a checksheet and stored in a database. If maintenance data exceeds an out of specification tolerance, the method and system include automatically notifying responsible personnel according to different levels of criticality. The method and system also permit creation of one of a plurality of workorders in a database.
